Final Website Proposal

For my final project, I'm revamping my website on "The Seasons" with a much stronger focus on design, clarity, animation, and interactivity. The site will have three main pages; a homepage, a Fall/Winter page, and a Spring/Summer page. As the user scrolls on the seasonal pages, the design will transition smoothly from one season to the next, with background colors, visuals, fonts, and animations shifting to reflect the change in mood and environment. Each season will have its own distinct font and custom color palette to create a more immersive and visually expressive experience. I will use both flexbox and grid to lay out content in a clean way that keeps the site organized and easy to navigate. To make the site more engaging, as my pure CSS animation I was thinking of a rotating sun for one example. For JavaScript I want to have something that triggers design and content changes based on scroll position. For jQuery, I plan to use the load and slidetoggle to show hidden content interactively, and I also want to explore a kaleidoscope-style drawing effect using jQuery to let users draw symmetrical lines that resemble snowflakes. I'll also include a p5.js animation, such as interactive floating flower petals or light particles that respond to mouse movement or scrolling. The navigation bar will be redesigned which I feel like I lacked on my midterm. I would like to add images of each season, and when you hover over it, you can actually click it which brings you to an external link of an annual event happening during that season. One of my biggest goals with this project is to redesign it and make the purpose of the site much clearer and more engaging from the start. I want the layout to create a seasonal experience that feels thoughtful, poetic, interactive, and visually pleasing.
